Office Action Summary

Application No.

10/669,390

Applicant(s)

ROSCOE ET AL.

Examiner

Russell S. Negin

Art Unit

1631

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 28 November 2005.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-25 is/are pending in the application.
- 4a) Of the above claim(s) 25 is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-24 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)
Paper No(s)/Mail Date _____ 12/30/03 & 1/2/04
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____

DETAILED ACTION

Election/Restrictions

Applicant's election of Specie A and Specie F in the reply filed on November 28, 2005 is acknowledged. Because applicant did not distinctly and specifically point out the supposed errors in the restriction requirement, the election has been treated as an election without traverse (MPEP § 818.03(a)).

Claim 25 is withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected specie, there being no allowable generic or linking claim. Election was made **without** traverse in the reply filed on November 28, 2005.

Claims investigated in this Office Action are claims 1-24.

Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claim 4 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 4 uses the abbreviation "H-bond," and it would be more effective if the full unabbreviated term is used. For the purposes of current examination, H-bonds signify hydrogen bonds.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1-5, 8, and 10-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Katz et al [Journal of Pharmaceutical Sciences, 1965, volume 54, pages 591-594] in view of Loftsson et al. [Drug Development and Industrial Pharmacy, 1994, volume 20, pages 1699-1708] in view of Tayar et al. [Journal of Pharmaceutical Science, volume 80, 1991, pages 590-598].

Claims 1-5, 8, and 10-24, state:

1. A method of formulating a pharmaceutical composition comprising:
 comparing parameters of at least one pharmaceutical and a plurality of compounds, wherein the parameters comprise at least log(P) and molecular weight;
 choosing at least one model compound from the plurality of compounds for each pharmaceutical;
 providing at least one model compound-excipient formulation comprising at least one model compound and at least one excipient;
 measuring the diffusion of a model compound of at least one model compound-excipient formulation across at least one membrane;
 choosing a model compound-excipient formulation based on the measured model compound diffusion; and
 combining components comprising the at least one pharmaceutical and the excipient package of the chosen model compound-excipient formulation.
2. A method according to claim 1, wherein the model compound-excipient formulation is saturated in model compound.
3. A method according to claim 1, wherein the parameters further comprise the number of freely rotatable bonds.
4. A method according to claim 1, wherein the parameters further comprise the number of H-bond donors and acceptors.
5. A method according to claim 1, wherein the diffusion is measured utilizing a Franz cell.
8. A method according to claim 6, wherein the diffusion of the model compound is simultaneously measured in a plurality of diffusion cells.
10. A method according to claim 1, wherein at least one model compound-excipient formulation comprises a plurality of different excipients.
11. A method according to claim 1, wherein diffusion is measured utilizing a chemical reaction.
12. A method according to claim 1, wherein at least one membrane comprises a synthetic polymer membrane.
13. A method according to claim 1, wherein at least one membrane comprises skin.
14. A method according to claim 1, wherein at least one membrane is selected from the group consisting of hairless mouse skin, snake skin, pig skin, and cadaver skin.

15. A method according to claim 1, wherein the parameters consist of $\log(P)$ and molecular weight.
16. A method according to claim 1, wherein at least one parameter of at least one model compound is calculated.
17. A method according to claim 1, wherein at least one parameter of at least one model compound is experimentally determined.
18. A method according to claim 1, wherein at least one parameter of the pharmaceutical is calculated.
19. A method according to claim 1, wherein at least one parameter of the pharmaceutical is experimentally determined.
20. A method according to claim 1, further comprising: contacting the pharmaceutical composition with the skin of a live mammal; and observing the result.
21. A method according to claim 1, further comprising incorporating the pharmaceutical composition into a transdermal delivery system.
22. A method according to claim 21, further comprising contacting the pharmaceutical composition with the skin of a live mammal and observing the result.
23. A method according to claim 21, wherein the transdermal delivery device comprises an adhesive patch.
24. A method according to claim 1, wherein prior to measuring diffusion of each model compound-exipient formulation, it is incorporated into an adhesive patch.

Katz et al. teach the first step of the body of claim 1 in Table 1 (page 593). Table 1 lists molecular weights and partition coefficients for a plurality of molecules. The molecular weights are deduced from the columns listing the combination of weight by volume concentrations and the molar concentrations. The partition coefficients are listed in the fifth column of data. This table, thus, also describes claim 15.

Claims 16 and 17 are also described by Table 1 in that McKenzie parameter ($p \text{ McK-S}_{50}$) is calculated in the last column as the negative logarithm of dilution

Art Unit: 1631

producing vasoconstriction of 50% of subjects (Claim 16) while the partition coefficients are experimentally measured (claim 17).

Claims 20-24 are described on page 592, column 2, lines 7-11, which state, "McKenzie and Stoughton... prepared dilutions of the corticosteroids in tenfold dilutions ranging from 1:100 to 1:10,000,000; 0.02 ml of these dilutions were applied to 1-in. areas of the forearm and covered with Saran wrap." Thus, the requirements of skin of a live mammal (claims 20 and 22) are met. The Saran wrap comprises an adhesive patch (claim 23), and the chemical is in contact with the adhesive patch (the Saran wrap) before it penetrates the skin (Claim 24). This entire system comprises a transdermal delivery system (claim 21).

There are two aspects of this rejection that Katz et al. fail to teach:

First, Katz et al. do not teach the compound-excipient formulation of claim 1, the diffusion method and analysis, saturation of the model compound, impact of rotatable and hydrogen bond donors and acceptors, use of a Franz cell(s), a plurality of excipients, utilization of a chemical reaction, use of a synthetic polymer membrane, calculated and empirical parameters of the pharmaceutical, and a transdermal delivery system.

In addition, while Katz et al. teach a partition coefficient between ether and water, they do not teach the required partition between octanol and water ($\log(P)$ is based on the partition coefficient between octanol and water).

To address the second concern, Tayar et al. teach the solvation of 121 solutes in five different solvent systems (octanol-water, heptane-water, chloroform-water, diethyl

Art Unit: 1631

ether-water, and butyl acetate-water) [abstract, page 590]. It would be obvious to adjust the partition study of Katz et al. from water-ether to water-octanol according to the procedures of this study of Tayar et al.; one would simply need to replace the ether with octanol.

To address the first concern, Loftsson et al. teach a method of making a pharmaceutical composition between hydrocortisone and different cyclodextrins to enhance transdermal delivery. (One of the model compounds listed in Table 1 of Katz et al. is hydrocortisone). Thus the preamble, and the second and third steps in the body of the claim are described. Figure 2 of Loftsson et al. teaches a relationship between diffusion through a membrane and cortisone concentration (the fourth body step) and the fifth body step is taught as the combination of the hydrocortisone and each of the cyclodextrins used in the formulation. Figure 2 additionally uses a synthetic polymer membrane (cellophane), which describes claim 12.

Claim 2 is described on page 1705 in Loftsson et al. under "Table 1," which shows as excess of cyclodextrin concentration used to saturate the hydrocortisone.

Claims 3 and 4 are described on page 1700 of Loftsson et al., lines 21-24, which state, "The molar substitution (MS) i.e. the average number of propylene oxide molecules that have reacted with one glucopyranose unit, was 0.6 or 0.9. HP β CD has a very good aqueous solubility (over 60% w/v) and forms stable complexes with many drugs." Thus, the type of molar substitution chosen for the cyclodextrin affects its size, number of rotatable bonds, and hydrogen bonding characteristics.

Claims 5, 8, 13, and 14 are described in Loftsson et al. on page 1702, the sixth and seventh lines from the bottom of the page which state, "Female hairless mice were killed by cervical dislocation, their full-thickness skins removed and placed in the previously described Franz diffusion cells." Thus Franz diffusion cells (claims 5 and 8) are used to measure diffusion across hairless mouse skin (claims 13 and 14).

Claim 11 is described in Loftsson et al. in that the chemical reaction between the cyclodextrin and the hydrocortisone is used to affect the diffusion across the skin.

Claim 10 is described in Loftsson et al. in that the formulation is chosen from one of two different cyclodextrins employed throughout the study.

Claims 18 and 19 are described in Table 2 of Loftsson et al., where the standard deviation of the flux needs to be calculated while the flux is an experimentally measured property.

Thus, it would have been obvious for someone of ordinary skill in the art at the time of the instant invention to combine the general corticosteroid study of Katz et al. with the cyclodextrin study of Loftsson et al. and the partition study of Tayar et al. because both Katz and Loftsson investigate cortisones as drugs with the added advantage of Loftsson having the feature of cyclodextrins to enhance drug performance; Tayar is a variation on the type of partition coefficient measured in Katz.

Claims 1 and 6-7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Katz in view of Loftsson in view of Tayar as applied to claims 1-5, 8, and 10-24 above, and further in view of Garcia-Ochoa [Chemistry- A European Journal, 1999, volume 5, pp. 897-901].

Claims 6 and 7 claim the drug formulation method of claim 1, wherein at least one model compound comprises a dye and the diffusion is monitored using fluorescence spectroscopy.

Katz, Loftsson, and Tayar claim the drug formulation process as stated in the instant application, but fail to disclose any use of fluorescence or fluorescence spectroscopy.

The last sentence in the second paragraph of the methods on page 901 of Garcia-Ochoa states, "¹H NMR spectra of 10⁻³M solutions of HPMO [a fluorescent dye] in D₂O in the absence and presence of 10⁻²M β-CD [cyclodextrin] (almost saturated solution) were recorded at 500 MHz on a Varian Unity spectrometer at 303K..." Thus the use of fluorescence and and fluorescent spectroscopy is employed to detect the cyclodextrins.

Thus, it would have been obvious for someone of ordinary skill in the art at the time of the instant invention to combine Katz in view of Loftsson in view of Tayar as applied to claims 1-5, 8, and 10-24 above, and further in view of Garcia-Ochoa. Garcia-Ochoa is an extension of the cyclodextrin study with the use of fluorescence to more effectively monitor cyclodextrin concentration and location.

Claims 1 and 8-9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Katz in view of Loftsson in view of Tayar in view of Garcia-Ochoa as applied to claims 1 and 6-7 above, and further in view of Colarusso et al [Biophysical Journal; February 2002; volume 82, pages 752-761].

Claim 9 claims the method of formulating a pharmaceutical composition of claim 1, but adds the limitation of recording an image of diffusion of a model compound.

Claim 8 claims the use of a plurality of diffusion cells.

Katz, Loftsson, Tayar, and Garcia-Ochoa teach of method of formulating a drug using a cortisone and a cyclodextrine and fluorescence, but fail to record any images in their studies.

Colarusso et al. illustrates several fluorescent images of cells and the effects of cyclodextrins on them in Figures 1-4 and 6-7.

Thus, it would have been obvious for someone of ordinary skill in the art at the time of the instant invention to combine Katz in view of Loftsson in view of Tayar in view of Garcia-Ochoa as applied to claims 1 and 6-7 above, and further in view of Colarusso et al; Colarusso et al. use cyclodextrins in analyzing images of cells.

Conclusion

No Claim is allowed.

Papers related to this application may be submitted to Technical Center 1600 by facsimile transmission. Papers should be faxed to Technical Center 1600 via the central PTO Fax Center. The faxing of such pages must conform with the notices published in the Official Gazette, 1096 OG 30 (November 15, 1988), 1156 OG 61 (November 16, 1993), and 1157 OG 94 (December 28, 1993)(See 37 CFR § 1.6(d)). The Central PTO Fax Center Number is (571) 273-8300.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Russell Negin, Ph.D., whose telephone number is (571) 272-1083. The examiner can normally be reached on Monday-Friday from 7am to 4pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's Supervisor, Ardin Marschel, Ph.D., Supervisory Patent Examiner, can be reached at (571) 272-0718.

Art Unit: 1631

Any inquiry of a general nature or relating to the status of this application should be directed to Legal Instrument Examiner, Tina Plunkett, whose telephone number is (571) 272-0549.

Information regarding the status of the application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information on the PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
